

SMART CARD READER

As threats become more sophisticated, developing strong authentication is a primary concern for all organizations, from government agencies, global corporations, to financial and medical institutions. The credential reader portfolio from FEITIAN provides multiple layers of security for the most sensitive data, preventing unauthorized access to critical systems and protecting trusted identities.

FEITIAN supports high-frequency cards, contact and contactless cards, and even mobile credentials, which improves compliance and enhances awareness about who, when, and where content is accessed. After all, access to computers and logical assets, such as specific servers and cloud applications, must be restricted to trusted identities, which must be both secure and easy to use.
